

Set Up Your AI for QuestOS

A step-by-step guide. No technical background needed.

What this does

Right now, if you ask ChatGPT or Claude about your week, it has to guess. It doesn't know what you're working on.

This guide connects your AI to QuestOS. After about ten minutes, you can ask your AI things like:

"What should I work on today?"

"What am I in the middle of?"

"What am I getting better at?"

And it will answer from your **actual** goals and tasks — not from guesses.

Your AI can only read. It cannot change anything. It can't add tasks, can't check things off, can't delete anything. It reads, and that's all.

What you need

- A QuestOS account (you signed in with a link sent to your email)
- **Claude Desktop** or **Claude Code** on your computer

***Note:** This currently works with Claude. ChatGPT and other assistants don't support this kind of connection yet. If you use something else, nothing here will work — that's not your fault, and it may change.*

Some words you'll see

You don't need to understand these deeply. Just enough to not be thrown by them.

MCP — a standard way for AI assistants to connect to outside tools. Think of it like a USB port: once something speaks MCP, any AI that also speaks MCP can plug into it.

Key — a long password, made just for this. It lets your AI read your QuestOS and nothing else. It's not your account password.

Config file — a small settings file on your computer that tells your AI what it's allowed to connect to. You'll paste a few lines into it.

Step 1 — Get your key

Takes about a minute.

- 1 Open QuestOS and make sure you're **signed in**. (Bottom right there's a small key icon [key icon] — click it. If it asks for your email, you're not signed in yet. Enter your email, then open the link it sends you **in the same web browser**.)
- 2 Open **your Quarters** — click the round picture of a suit of armor at the end of the three room names at the top (on a computer it sits just to the right of them).
- 3 Scroll down until you see **The Ring of Keys**.
- 4 In the box, type what you'll use this key for. Something like `my laptop` is fine. This is only a label so you can recognise it later.
- 5 Click **Cut a new key**.
- 6 **Copy the key right away**. Click the **Copy the key** button, or select the text and copy it.

Important

The key is shown once and then it's gone forever. We don't store it — we only keep a scrambled fingerprint of it, so nobody can look it up later. Not another user, and not us.

If you close the page without copying it, nothing bad happens. Just come back and cut another one.

Your key looks something like this:

```
qos_kJ8xR2mQpL4vN7wY3zB6cF9hT1sD5gA0
```

Paste it somewhere safe for the next few minutes — a note, or just leave the page open.

Step 2 — Put the key in your AI's settings

Pick the one you use.

If you use Claude Desktop

- 1 Open Claude Desktop.
- 2 Go to **Settings** (from the Claude menu at the top of your screen).
- 3 Click **Developer**, then **Edit Config**. A file opens in a text editor.
- 4 You'll see something that starts with `{` and ends with `}`. If the file is completely empty, paste this whole block in.

```
{
  "mcpServers": {
    "questos": {
      "type": "http",
      "url": "https://quest-os-nine.vercel.app/api/mcp",
      "headers": {
        "Authorization": "Bearer PASTE_YOUR_KEY_HERE"
      }
    }
  }
}
```

- 1 Replace PASTE_YOUR_KEY_HERE with the key you copied. ****Keep the word Bearer and the space after it.**** It should end up looking like "Bearer qos_kJ8xR2...".
- 2 Save the file.
- 3 **Quit Claude Desktop completely and open it again.** Closing the window isn't enough — quit it properly. It only reads that file when it starts.

If you use Claude Code

- 1 In your terminal, go to any folder you work in.
- 2 Create or open a file called `.mcp.json` in that folder.
- 3 Paste the same block as above, with your key.
- 4 Save it, and restart Claude Code.

Step 3 — Try it

Ask your AI:

"What are my open roads in QuestOS?"

If it lists your actual quests, you're done.

Other things to try:

"What should I focus on today according to QuestOS?"

"What skills am I building?"

"Find anything in my QuestOS about the kitchen."

If something doesn't work

"I don't see The Ring of Keys"

You're not signed in. Click the [key icon] at the bottom right and enter your email, then open the link it emails you **in the same browser you're using**.

My AI says it can't find QuestOS

Three things to check, in order:

- 1 **Did you fully quit and reopen the app?** This is the most common one. Closing the window isn't quitting.
- 2 ****Is the word Bearer still there,**** with a space after it, before your key?
- 3 **Are all the quotes and commas intact?** JSON is fussy. One missing comma breaks the whole file. If you're unsure, delete everything and paste the block again fresh.

"That key opens nothing"

The key is wrong or was typed rather than pasted. Cut a new one — it takes ten seconds, and old keys don't get in the way.

Watch out for an accidental space at the beginning or end when you paste.

My AI says my QuestOS is empty

You're signed in, but nothing has been saved to your account yet. Open QuestOS, change something (tick a task, add one), then ask again.

My AI tried to change something and couldn't

That's correct. It's read-only on purpose. To change something, do it in QuestOS itself — or tell the squire in the app, which *can* act.

Common questions

Can my AI see my journal or my private notes?

No. It can see titles, dates, progress and skill levels. It **cannot** see your journal, your morning pages, your evening reflections, your private notes on tasks, or your descriptions. Those never leave.

This isn't a promise about good behaviour — the notes are filtered out before anything is sent, and there are automated tests that fail if a single private word ever gets through.

Can other people see my QuestOS?

No. Your key reads your account and no one else's. Nobody else's key can reach yours.

What if I lose my key, or think someone else has it?

Cut a new one any time. To shut an old key off completely, email whoever set you up and ask them to revoke it. (*A revoke button is coming.*)

Does this cost anything?

No. Your AI subscription is your own and this doesn't touch it. QuestOS doesn't charge for reading your own information.

Do I have to do this?

Not at all. QuestOS works perfectly without it. This is for people who already talk to an AI every day and want it to stop guessing.

In one picture

You ask your AI a question
↓
Your AI uses your key
↓
QuestOS checks the key,

finds YOUR account only
↓
Sends back: titles, dates,
progress, skill levels
(never your private words)
↓
Your AI answers you

Nothing goes the other way. Your AI cannot write to QuestOS.

Stuck? Send feedback from inside QuestOS — tap the white pigeon [white pigeon] in the bottom-left corner and describe what happened. That reaches a human.
